WO 2006/029115 A2

2-AMINO 1H-IMIDAZO RING SYSTEMS AND METHODS

RELATED APPLICATIONS

The present invention claims priority to U.S. Provisional Application Serial No. 60/606,607, filed September 2, 2004, which is incorporated herein by reference.

BACKGROUND

Certain compounds have been found to be useful as immune response modifiers (IRMs), rendering them useful in the treatment of a variety of disorders. There continues to be interest in and a need for compounds that have the ability to modulate the immune response, by induction of cytokine biosynthesis or other mechanisms.

SUMMARY OF THE INVENTION

It has now been found that certain 2-amino 1H-imidazo ring systems modulate cytokine biosynthesis. In one aspect, the present invention provides compounds of the Formula I:

I

and more specifically the following compounds of the Formulas II, III, IV, V, VI, VII, and VIII:

II

III

IV

V

VI

VII

VIII

wherein R, R', R₁, R₂, R₂', R₃, R_A, R_B, R_{A1}, R_{B1}, R_{A2}, R_{B2}, G, m, n, and p are as defined below; and pharmaceutically acceptable salts thereof.

The compounds of Formulas I, II, III, IV, V, VI, VII, and VIII are useful as immune response modifiers (IRMs) due to their ability to modulate cytokine biosynthesis (e.g., induce or inhibit the biosynthesis or production of one or more cytokines) and otherwise modulate the immune response when administered to animals. Compounds can be tested per the test procedures described in the Examples Section. Compounds can be tested for induction of cytokine biosynthesis by incubating human peripheral blood mononuclear cells (PBMC) in a culture with the compound(s) at a concentration range of 30 to 0.014 μ M and analyzing for interferon (α) or tumor necrosis factor (α) in the culture supernatant. Compounds can be tested for inhibition of cytokine biosynthesis by incubating mouse macrophage cell line Raw 264.7 in a culture with the compound(s) at a single concentration of, for example, 5 μ M and analyzing for tumor necrosis factor (α) in the culture supernatant. The ability to modulate cytokine biosynthesis, for example, induce the biosynthesis of one or more cytokines, makes the compounds useful in the treatment of a variety of conditions such as viral diseases and neoplastic diseases, that are responsive to such changes in the immune response.

In another aspect, the present invention provides pharmaceutical compositions containing the immune response modifier compounds, and methods of inducing cytokine biosynthesis in animal cells, treating a viral disease in an animal, and/or treating a neoplastic disease in an animal by administering to the animal one or more compounds of the Formulas I, II, III, IV, V, VI, VII, and/or VIII, and/or pharmaceutically acceptable salts thereof.

In another aspect, the invention provides methods of synthesizing the compounds of Formulas I, II, III, IV, V, VI, VII, and VIII and intermediate compounds useful in the synthesis of these compounds.

As used herein, "a", "an", "the", "at least one", and "one or more" are used interchangeably.

The terms "comprising" and variations thereof do not have a limiting meaning where these terms appear in the description and claims.

The above summary of the present invention is not intended to describe each disclosed embodiment or every implementation of the present invention. The description

that follows more particularly exemplifies illustrative embodiments. Guidance is also provided herein through lists of examples, which can be used in various combinations. In each instance, the recited list serves only as a representative group and should not be interpreted as an exclusive list.

In addition, many of the compounds prepared by the methods described below can be further modified in light of this disclosure using conventional methods well known to those skilled in the art.

In the preparation of compounds of the invention it may sometimes be necessary to protect a particular functionality while reacting other functional groups on an intermediate. The need for such protection will vary depending on the nature of the particular functional group and the conditions of the reaction step. Suitable amino protecting groups include acetyl, trifluoroacetyl, *tert*-butoxycarbonyl (Boc), benzyloxycarbonyl, and 9-fluorenylmethoxycarbonyl (Fmoc). Suitable hydroxy protecting groups include acetyl and silyl groups such as the *tert*-butyl dimethylsilyl group. For a general description of protecting groups and their use, see T. W. Greene and P. Conventional methods and techniques of separation and purification can be used to isolate compounds of the invention, as well as various intermediates related thereto. Such techniques may include, for example, all types of chromatography (high performance liquid chromatography (HPLC), column chromatography using common absorbents such as silica gel, and thin layer chromatography), recrystallization, and differential (i.e., liquid-liquid) extraction techniques.

Compounds of the invention can be prepared according to Reaction Scheme I, wherein R, R₁, R₂, R₂', R_{4a}, and n are as defined above, and R_{2a} is -X₂-R_{5a} or -X₂-N(R_{8a})-Q_a-R_{4a}. In step (1) or (1a) of Reaction Scheme I, a 2-chloroquinoline-3,4-diamine of Formula XIII reacts with a isothiocyanate of Formula R_{4a}N=C=S or R₂'N=C=S to provide a thiourea, which cyclizes to a 1*H*-imidazo[4,5-*c*]quinolin-2-amine of Formula XIV or XVI. Many isothiocyanates are commercially available; others can be prepared using conventional synthetic methods. Several 2-chloroquinoline-3,4-diamines of Formula XIII are known or can be prepared using known methods. See, for example, U.S. Patent Nos. 4,988,815 (André *et al*); 6,069,149 (Nanba *et al*); 6,518,265 (Kato *et al*), 6,670,372 (Charles *et al*); 6,683,088 (Crooks *et al*); and 6,664,260 (Charles *et al*). For some embodiments, the R₁ group on a compound of Formula XIII is converted to another R₁ group using a variety of synthetic methods. For example, a compound or salt of Formula XIII wherein R₁ is a *tert*-butyl group can be converted to a compound of Formula XIII wherein R₁ is hydrogen by heating the *tert*-butyl amine with hydrochloric acid in a suitable solvent such as methanol at an elevated temperature such as 75 °C. In another example, a compound of Formula XIII wherein R₁ is -X₁-NH-Boc, in which Boc is *tert*-butoxycarbonyl, can be converted to a compound of Formula XIII wherein R₁ is R_{1a} using the methods of Reaction Scheme III below. Similarly, a compound of Formula XIII wherein R₁ is

Formula XIII wherein R₁ is

Scheme III.

can be converted to a compound of

using the methods of Reaction

Some compounds of XIII in which R_1 is a 1-hydroxycycloalkylmethyl group or a 2-fluoro-2-methylpropyl group can be prepared in two steps by (i) reacting 2,4-dichloro-3-nitroquinoline with an amine of formula H_2N-R_1 or a salt thereof and (ii) reducing the nitro group using conventional methods. Methods that can be used to carry out step (i) and step (ii) are described in the U. S. Patents referenced above.

Some amines of the Formula H_2N-R_1 in which R_1 is a 1-hydroxycycloalkylmethyl group, or salts thereof, are commercially available. Others can be prepared by known methods. For example, cyanide anion, which can be generated by complexing potassium cyanide and 18-Crown-6, can be added to a cyclic ketone in the presence of trimethylsilyl cyanide. The reaction may be carried out neat or in a suitable solvent at or below room temperature. The resulting cyanohydrin can then be reduced to a 1-aminomethyl alcohol using conventional methods; for example, the cyanohydrin can be combined with lithium aluminum hydride in a suitable solvent, such as tetrahydrofuran, at a sub-ambient temperature, such as 0 °C. Amines of Formula H_2N-R_1 in which R_1 is a 1-hydroxycycloalkylmethyl may also be prepared by combining a cyclic ketone with excess nitromethane in a suitable solvent such as ethanol or methanol in the presence of a catalytic amount of base such as sodium ethoxide or sodium hydroxide and reducing the resultant nitromethyl-substituted compound using conventional heterogeneous hydrogenation conditions. The hydrogenation is typically carried out in the presence of a catalyst such as palladium hydroxide on carbon, palladium on carbon, or Raney nickel in a suitable solvent such as ethanol. Both the reaction with nitromethane and the reduction can be carried out at ambient temperature. A wide variety of cyclic ketones, such as cyclopentanone and cyclobutanone, can be obtained from commercial sources; others can be synthesized using known synthetic methods.

For some embodiments, R_1 is a 2-fluoro-2-methylpropyl group. The corresponding amine of Formula H_2N-R_1 or a salt thereof can be prepared in three steps by (i) protecting the amino group of 1-amino-2-methylpropan-2-ol with a suitable protecting group such as a Boc group, (ii) converting the hydroxy group into a fluoro group, and (iii) deprotecting the amino group. The fluorination in step (ii) can be carried out by combining the protected amino alcohol with (diethylamino)sulfur trifluoride in a suitable solvent such as dichloromethane. The reaction can be carried out at or below room

temperature. The protection and deprotection steps can be carried out by conventional methods.

The syntheses of other useful amines of Formula H_2N-R_1 , such as 2,2-dimethyl-3-(2-methyl-[1,3]dioxolan-2-yl)propylamine and tetrahydro-2*H*-pyran-4-ylmethylamine, have been reported; see, International Patent Application Publication No. WO2005/051317 (Krepeski *et al.*) and U. S. Patent Application Publication No. 2004/0147543 (Hays *et al.*) Examples 477-480. These amines can be used to prepare compounds of Formula XIII wherein R_1 is a 2,2-dimethyl-4-oxopentyl, after ketal deprotection, or a tetrahydro-2*H*-pyran-4-ylmethyl group. Many other amines of Formula H_2N-R_1 , such as, for example, substituted benzyl amines, are commercially available and can be used to make compounds of Formula XIII.

The reaction in step (1) and (1a) is conveniently carried out by combining a 2-chloroquinoline-3,4-diamine of Formula XIII with an isothiocyanate in the presence of a desulfurizing agent such as 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride and a base such as triethylamine. The reaction is carried out in a suitable solvent such as toluene or pyridine at an elevated temperature such as 80 °C. Alternatively, to prepare compounds or salts of Formula XIV or XVI, wherein R_{4a} or R_2' is hydrogen, the reaction is conveniently carried out by adding cyanogen bromide to a solution of a 2-chloroquinoline-3,4-diamine of Formula XIII in a suitable solvent such as ethanol and heating at an elevated temperature such as 65 °C to 120 °C, preferably 80 °C to 110 °C. Optionally, a base such as triethylamine can be added.

In step (2) or (2a) of Reaction Scheme I, a 4-chloro-1*H*-imidazo[4,5-*c*]quinolin-2-amine of Formula XIV or XVI is aminated to provide a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XV or XVII, which are both subgenera of Formula I, II, and IV. The reaction is conveniently carried out by adding a solution of ammonia in a suitable solvent such as methanol to a compound of Formula XIV or XVI and heating the reaction at an elevated temperature such as 135 °C to 175 °C, preferably 150 °C to 170 °C.

Step (3) of Reaction Scheme I may be used to convert a compound of Formula XV to a compound of Formula XVa, wherein R_{2a} is $-X_2-R_{5a}$ or $-X_2-N(R_{8a})-Q_a-R_{4a}$, using a variety of functional group transformations. For example, a compound of Formula XV wherein R_{4a} is $-X_2-OCH_3$, which can be prepared by using an isothiocyanate in step (1) such as 2-methoxyethyl isothiocyanate or 3-methoxypropyl isothiocyanate, can be

demethylated using conventional methods. The demethylation can be carried out by treating a compound of Formula XV wherein R_{4a} is $-X_2-OCH_3$ with BBr_3 in a suitable solvent such as dichloromethane at a sub-ambient temperature such as $-78^\circ C$. The resulting compound of Formula XV wherein R_{4a} is $-X_2-OH$ can be converted to a compound of Formula XV wherein R_{4a} is $-X_2-NH_2$ by conversion of the hydroxy group to a leaving group such as a methanesulfonate, treatment with sodium azide, and subsequent reduction using conventional methods. The compound of Formula XV wherein R_{4a} is $-X_2-NH_2$ can be converted to a compound of Formula XVa using conventional methods. For example, a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine wherein R_{4a} is $-X_2-NH_2$ can react with an acid chloride of Formula $R_{4a}C(O)Cl$, a sulfonyl chloride of Formula $R_{4a}S(O)_2Cl$, or a sulfonic anhydride of Formula $(R_{4a}S(O)_2)_2O$ to provide a compound of Formula XVa wherein R_{2a} is $-X_2-N(R_{8a})-Q_a-R_{4a}$ in which Q_a is $-C(O)-$ or $-S(O)_2-$. Numerous acid chlorides, sulfonyl chlorides, and sulfonic anhydrides are commercially available; others can be readily prepared using known synthetic methods. The reaction can be conveniently carried out by adding the acid chloride, sulfonyl chloride, or sulfonic anhydride to a solution of a compound of Formula XV wherein R_{4a} is $-X_2-NH_2$ and a base such as triethylamine in a suitable solvent such as chloroform, dichloromethane, or acetonitrile. The reaction can be carried out at ambient temperature or a sub-ambient temperature such as $0^\circ C$.

Ureas of Formula XVa, wherein R_{2a} is $-X_2-N(R_{8a})-Q_a-R_{4a}$ in which Q_a is $-C(R_6)-N(R_{8a})-W-$, can be prepared by reacting a compound of Formula XV wherein R_{4a} is $-X_2-NH_2$ with isocyanates of Formula $R_{4a}N=C=O$ or carbamoyl chlorides of Formula $R_{4a}N-(R_{8a})-C(O)Cl$. Numerous isocyanates and carbamoyl chlorides are commercially available; others can be readily prepared using known synthetic methods. The reaction can be conveniently carried out as described above for the reaction with acid chlorides or sulfonyl chlorides. Alternatively, a compound of Formula XV wherein R_{4a} is $-X_2-NH_2$ can be treated with an isocyanate of Formula $R_{4a}(CO)N=C=O$, a isothiocyanate of Formula $R_{4a}N=C=S$, or a sulfonyl isocyanate of Formula $R_{4a}S(O)_2N=C=O$ to provide a compound of Formula XVa wherein R_{4a} is $-X_2-N(R_{8a})-C(R_6)-N(R_{8a})-R_{4a}$, in which R_6 , R_{8a} , and W are defined as above.

A 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XV wherein R_{4a} is

-X₂-NH₂ can also be converted to a compound of Formula XVa, wherein R_{2a} is -X₂-R_{5a} by reaction with a chloroalkanesulfonyl chloride of Formula Cl-R_{7a}S(O)₂Cl or a chloroalkanoyl chloride of Formula Cl-R_{7a}C(O)Cl, wherein R_{7a} is as defined above. The reaction is conveniently carried out by adding the chloroalkanesulfonyl chloride or chloroalkanoyl chloride to a solution of the amine in a suitable solvent such as chloroform or dichloromethane in the presence of a base such as triethylamine at ambient temperature. The isolable intermediate chloroalkanesulfonamide or chloroalkanamide can then be treated with a base such as 1,8-diazabicyclo[5.4.0]undec-7-ene at ambient temperature in a suitable solvent such as *N,N*-dimethylformamide (DMF) to effect the cyclization to afford a compound of Formula XVa in which R_{2a} is -X₂-R_{5a}.

In step (3a) of Reaction Scheme I, a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XVII is converted to a compound of Formula XVIII, a subgenus of Formulas I, II, and IV, using a variety of methods. For example, a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XVII can be converted to a compound of Formula XVIII, wherein R₂ is -Q₂-R_{4a} by reaction with an acid chloride of Formula R_{4a}C(O)Cl or Cl-R_{7a}C(O)Cl, a sulfonyl chloride of Formula R_{4a}S(O)₂Cl or Cl-R_{7a}S(O)₂Cl, a sulfonic anhydride of Formula (R_{4a}S(O)₂)₂O, an isocyanate of Formula R_{4a}N=C=O, R_{4a}(CO)N=C=O, R_{4a}N=C=S, or R_{4a}S(O)₂N=C=O, or a carbamoyl chloride of Formula R_{4a}N-(R₈)-C(O)Cl according to the methods described above in step (3). Alternatively, a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XVII can be treated with a variety of arylalkylenyl or alkyl halides in the presence of a base such as potassium carbonate in a suitable solvent such as DMF to provide a compound of Formula XVIII, wherein R₂ is R_{4a}. Numerous arylalkylenyl or alkyl halides are commercially available; others can be prepared by known methods. Some compounds of Formula XVIII wherein R₂ is R_{4a} that are prepared in this step can be converted to compounds of Formula XVIII wherein R₂ is R_{2a} according to the methods described above in step (3).

Reaction Scheme I

Compounds of the invention can also be prepared according to Reaction Scheme II, wherein R , R_1 , R_2 , R_2' , R_{4a} , $N(Bn)_2$, m , and n are as defined above, and D is $-Br$, $-I$, or $-OCH_2Ph$, wherein Ph is phenyl. In step (1) of Reaction Scheme II, a 3-nitroquinoline-2,4-diol of Formula XIX is converted to an amine-substituted quinolin-2-yltrifluoromethanesulfonate of Formula XX. The compound of Formula XIX wherein n and m are 0 is a commercially available compound, and other 3-nitroquinoline-2,4-diols of Formula XIX can be prepared from substituted anilines according to the methods described in Kohler *et al*, *Chem. Ber.* 60, p. 1108 (1927); Buckle *et al*, *J. Med. Chem.*, 18, pp. 726-732 (1975), and Kappe *et al*, *J. Heterocyclic Chem.* 25, p. 857, (1988). Step (1) is conveniently carried out by adding two equivalents of trifluoromethanesulfonic anhydride to a solution of the 3-nitroquinoline-2,4-diol of Formula XIX in a suitable solvent such as dichloromethane in the presence of a base such as triethylamine. The reaction can be run at an elevated temperature, such as the reflux temperature of the solvent, and then cooled before the addition of one equivalent of an amine of Formula R_1-NH_2 . The reaction can then be stirred at ambient temperature to provide a compound of Formula XX. The reaction can also be carried out under the conditions described in U.S. Patent No. 5,395,937 (Nikolaides *et al*), and the intermediate 3-nitroquinoline-2,4-disulfonate can optionally be isolated before the reaction with the amine of Formula R_1-NH_2 . Numerous amines of Formula R_1-NH_2 are commercially available; others can be prepared using known methods, including the methods described in Reaction Scheme I.

In step (2) of Reaction Scheme II, the trifluoromethanesulfonate group in a quinoline of Formula XX is displaced by an amine of Formula $\text{HN}(\text{Bn})_2$ to provide quinoline of Formula XXI. The displacement is conveniently carried out by combining an amine of Formula $\text{HN}(\text{Bn})_2$ and a compound of Formula XX in a suitable solvent such as toluene or xylenes in the presence of a base such as triethylamine and heating at an elevated temperature such as the reflux temperature of the solvent.

In step (3) of Reaction Scheme II, a compound of Formula XXI is reduced to provide a quinoline-2,3,4-triamine of Formula XXII. The reaction can be carried out by hydrogenation using platinum on carbon as the heterogeneous hydrogenation catalyst. The hydrogenation is conveniently carried out in a Parr apparatus in a suitable solvent such as toluene, methanol, acetonitrile, or ethyl acetate. The reaction can be carried out at ambient temperature. The reaction can be carried out using alternative methods as described in U.S. Patent No. 5,395,937 (Nikolaides et al).

In step (4) of Reaction Scheme II, a quinoline-2,3,4-triamine of Formula XXII is cyclized to a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XXIII. The reaction is carried out according to the methods described in step (1) or (1a) of Reaction Scheme I.

In step (5) of Reaction Scheme II, the protecting groups are removed from the 4-amine of a compound of Formula XXIII to provide a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XXIV, a subgenus of Formulas I, II, and IV. The reaction is conveniently carried out by adding trifluoroacetic acid to a compound of Formula XXIII and heating at an elevated temperature such as 50-70 °C.

In step (6) of Reaction Scheme II, a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XXIV is converted to a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XXV, a subgenus of Formulas I, II, and IV, using one or more of the methods described in step (3) and step (3a) of Reaction Scheme I.

In Reaction Scheme II, when *m* is 1, step (7) is used to convert a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XXV to a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula IVe, a subgenus of Formulas I, II, and IV wherein R_3 is R_{3a} , using a variety of methods. When *D* is -Br or -I, compound of Formula XXIV can undergo known palladium-catalyzed coupling reactions such as the Suzuki coupling and the Heck reaction. For example, a bromine or iodine-substituted 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XXV undergoes Suzuki coupling with a boronic acid of Formula $\text{R}_{3a}\text{-B}(\text{OH})_2$, an

anhydride thereof, or a boronic acid ester of Formula $R_{3a}-B(O-alkyl)_2$; wherein R_{3a} is $-R_{4b}$, $-X_a-R_4$, $-X_b-Y-R_4$, or $-X_b-R_5$; where X_a is alkenylene; X_b is arylene, heteroarylene, and alkenylene interrupted or terminated by arylene or heteroarylene; R_{4b} is aryl or heteroaryl where the aryl or heteroaryl groups can be unsubstituted or substituted as defined in R_4 above; and R_4 , R_5 , and Y are as defined above. The coupling is carried out by combining a compound of Formula XXV with a boronic acid or an ester or anhydride thereof in the presence of palladium (II) acetate, triphenylphosphine, and a base such as sodium carbonate in a suitable solvent such as *n*-propanol. The reaction can be carried out at an elevated temperature, for example, at the reflux temperature. Numerous boronic acids of Formula $R_{3a}-B(OH)_2$, anhydrides thereof, and boronic acid esters of Formula $R_{3a}-B(O-alkyl)_2$ are commercially available; others can be readily prepared using known synthetic methods.

The Heck reaction can also be used in step (7) of Reaction Scheme II to provide compounds of Formula IVe, wherein R_3 is $-X_a-R_{4b}$ and $-X_a-Y-R_4$. The Heck reaction is carried out by coupling a compound of Formula XXV with a compound of the Formula $H_2C=C(H)-R_{4b}$ or $H_2C=C(H)-Y-R_4$. Several of these vinyl-substituted compounds are commercially available; others can be prepared by known methods. The reaction is conveniently carried out by combining the compound of Formula XXV and the vinyl-substituted compound in the presence of palladium (II) acetate, triphenylphosphine or tri-*ortho*-tolylphosphine, and a base such as triethylamine in a suitable solvent such as acetonitrile or toluene. The reaction can be carried out at an elevated temperature such as 100-120 °C under an inert atmosphere.

Compounds of Formula IVe, wherein R_3 is $-X_c-R_4$, X_c is alkynylene, and R_4 is as defined above, can also be prepared by palladium catalyzed coupling reactions such as the Stille coupling or Sonogashira coupling. These reactions are carried out by coupling a compound of Formula XXV with a compound of the Formula $(alkyl)_3Sn-C\equiv C-R_4$, $(alkyl)_3Si-C\equiv C-R_4$, or $H-C\equiv C-R_4$.

Compounds of Formula IVe prepared as described above by palladium-mediated coupling reactions, wherein R_3 is $-X_a-R_4$, $-X_a-Y-R_4$, $-X_{b2}-Y-R_4$, $-X_{b2}-R_5$, or $-X_c-R_4$, where X_{b2} is alkenylene interrupted or terminated by arylene or heteroarylene, and X_a , X_c , Y , R_4 , and R_5 are as defined above, can undergo reduction of the alkenylene or alkynylene group present to provide compounds of Formula IVe wherein R_3 is $-X_d-R_4$, $-X_d-Y-R_4$, $-X_e-Y-R_4$,

or $-X_e-R_5$, where X_d is alkylene; X_e is alkylene interrupted or terminated by arylene or heteroarylene; and R_4 , R_5 , and Y are as defined above. The reduction can be carried out by hydrogenation using a conventional heterogeneous hydrogenation catalyst such as palladium on carbon. The reaction can conveniently be carried out on a Parr apparatus in a suitable solvent such as ethanol, methanol, or mixtures thereof.

Compounds of Formula XXV wherein D is $-OCH_2Ph$ can be converted in step (7) to compounds of Formula IVe wherein R_3 is $-O-R_{4b}$, $-O-X-R_4$, $-O-X-Y-R_4$, or $-O-X-R_5$; wherein R_4 , R_{4b} , R_5 , X , and Y are as defined above. When D is $-OCH_2Ph$, step (7) is carried out in two parts. In part (i), the benzyl group in a benzyloxy-substituted 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XXV is cleaved to provide a hydroxy group. The cleavage is conveniently carried out on a Parr apparatus under hydrogenolysis conditions using a suitable heterogeneous catalyst such as palladium or platinum on carbon in a solvent such as ethanol. Alternatively, the reaction can be carried out by transfer hydrogenation in the presence of a suitable hydrogenation catalyst. The transfer hydrogenation is conveniently carried out by adding ammonium formate to a solution of a compound of Formula XXV in a suitable solvent such as ethanol in the presence of a catalyst such as palladium on carbon. The reaction is carried out at an elevated temperature, for example, the refluxing temperature of the solvent.

In part (ii) of step (7) of Reaction Scheme II, the hydroxy-substituted compound prepared in part (i) is converted to a compound of Formula IVe, wherein R_3 is $-O-R_{4b}$, $-O-X-R_4$, $-O-X-Y-R_4$, or $-O-X-R_5$, using a Williamson-type ether synthesis. The reaction is effected by treating a hydroxy-substituted 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine with an aryl, alkyl, or arylalkylenyl halide of Formula Halide- R_{4b} , Halide-alkylene- R_4 , Halide-alkylene- $Y-R_4$, or Halide-alkylene- R_5 in the presence of a base. Numerous alkyl, arylalkylenyl, and aryl halides of these formulas are commercially available, including substituted benzyl bromides and chlorides, substituted or unsubstituted alkyl or arylalkylenyl bromides and chlorides, and substituted fluorobenzenes. Other halides of these formulas can be prepared using conventional synthetic methods. The reaction is conveniently carried out by combining an alkyl, arylalkylenyl, or aryl halide with the hydroxy-substituted compound prepared in part (i) in a solvent such as DMF in the presence of a suitable base such as cesium carbonate. Optionally, catalytic tetrabutylammonium bromide can be added. The reaction can be carried out at ambient

temperature or at an elevated temperature, for example 65 °C or 85 °C, depending on the reactivity of the halide reagent. Alternatively, part (ii) may be carried out using the Ullmann ether synthesis, in which an alkali metal aryloxy prepared from the hydroxy-substituted compound made in part (i) reacts with an aryl halide in the presence of copper salts, to provide a compound of Formula IVe, where R_3 is $-O-R_{4b}$, $-O-X_f-R_4$, or $-O-X_f-Y-R_4$, wherein X_f is an arylene or heteroarylene. Numerous substituted and unsubstituted aryl halides are commercially available; others can be prepared using conventional methods.

Reaction Scheme II

For some embodiments, compounds of the invention can undergo further synthetic elaboration using conventional methods. An example is shown in Reaction Scheme III, wherein R , X_1 , R_{4a} , $N(Bn)_2$, and n are as defined above; Boc is *tert*-butoxycarbonyl; and R_{1a} is $-X_1-N(R_8)-Q-$,

Q, A, a and b are as defined above. Compounds of Formula XXVI can be prepared according to the methods described in Reaction Scheme II, wherein an amine of Formula Boc-NH-X₁-NH₂ is employed in step (1) of Reaction Scheme II.

In step (1) of Reaction Scheme III, the amine protecting groups are removed under acidic conditions. The conditions described in step (5) of Reaction Scheme II can be used to cleave both the Bn and Boc protecting groups to provide a 1-amino-substituted 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XXVII, a subgenus of Formulas I, II, and IV.

In step (2) of Reaction Scheme III, the 1-amino group in a compound of Formula XXVII is treated with an acid chloride of Formula R₄C(O)Cl or Cl-R₇C(O)Cl, a sulfonyl chloride of Formula R₄S(O)₂Cl or Cl-R₇S(O)₂Cl, a sulfonic anhydride of Formula (R₄S(O)₂)₂O, an isocyanate of Formula R₄N=C=O, R₄(CO)N=C=O, R₄N=C=S, or R₄S(O)₂N=C=O, a carbamoyl chloride of Formula R₄N-(R₈)-C(O)Cl or

or a sulfamoyl chloride of Formula R₄-N(R₈)-S(O)₂Cl according to the reaction conditions described in step (3) of Reaction Scheme I to provide an amide, sulfonamide, urea, or sulfamide. The product can be isolated as a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine of Formula XXVIII, a subgenus of Formulas I, II, and IV, or as a pharmaceutically acceptable salt thereof.

Reaction Scheme III

Imidazopyridine-2,4-diamines of the invention can be prepared according to Reaction Scheme IV, where R_1 , R_{A2} , R_{B2} , Ph, R_{4a} , R_2 , and R_2' are as defined above. In step (1) of Reaction Scheme IV, a 2-phenoxy-3,4-diamine of Formula XXIX is converted to a 4-phenoxy-1*H*-imidazo[4,5-*c*]pyridine of Formula XXX by reaction with a thiourea or cyanogen bromide. The reaction can be carried out as described in step (1) of Reaction Scheme I. Several 2-phenoxy-3,4-diamines of Formula XXIX are known or can be prepared by published methods. See, for example, U. S. Patent No. 6,545,016 (Dellaria *et al*); 6,743,920 (Lindstrom *et al.*), and 6,797,718 (Dellaria *et al.*).

In step (2) of Reaction Scheme IV, a 4-phenoxy-1*H*-imidazo[4,5-*c*]pyridine of Formula XXX is aminated to provide a 1*H*-imidazo[4,5-*c*]pyridine-2,4-diamine of Formula XXXI, a subgenus of Formulas I, II, and III. The reaction is conveniently carried out by adding a solution of ammonia in a suitable solvent such as methanol to a compound of Formula XXX and heating the reaction at an elevated temperature such as 170 °C.

In step (3) of Reaction Scheme IV, a compound of Formula XXXI is converted to a compound of Formula XXXII using a variety of functional group transformations, for example, the methods described in steps (3) and (3a) of Reaction Scheme I. The product can be isolated as a compound of Formula XXXII, a subgenus of Formulas I, II, and III, or as a pharmaceutically acceptable salt thereof.

Reaction Scheme IV

Imidazo[4,5-*c*][1,5]naphthyridine-2,4-diamines of the invention can be prepared according to Reaction Scheme V, wherein D, R, R_1 , R_{4a} , Ph, m, and p are as defined above. 3-Aminopyridine-2-carboxylic acids of Formula XXXIII are known and can be prepared by known methods. The compound where n and m are both 0 is commercially available. In step (1) of Reaction Scheme V, a 3-aminopyridine-2-carboxylic acid of

Formula III is heated with acetic anhydride to provide a 2-methyl-4*H*-pyrido[3,2-*d*][1,3]oxazin-4-one of Formula XXXIV.

In step (2) of Reaction Scheme V a compound of Formula XXXIV is combined with sodium azide in a suitable solvent such as acetic acid to provide a tetraazolyl pyridine-2-carboxylic acid of Formula XXXV. The reaction conveniently may be run at ambient temperature.

In step (3) of Reaction Scheme V an acid of Formula XXXV is esterified by conventional methods to provide a compound of Formula XXXVI. The reaction is conveniently carried out by combining the acid of Formula XXXV with ethyl iodide in the presence of a base such as potassium carbonate in a suitable solvent such as acetone.

In step (4) of Reaction Scheme V a compound of Formula XXXVI is cyclized to provide a tetraazolo[1,5-*a*][1,5]naphthyridin-5-ol of Formula XXXVII. The reaction may be carried out by treating the compound of Formula XXXVI with an alkoxide base such as potassium ethoxide in a suitable solvent such as DMF. The reaction can be run at ambient temperature.

In step (5) of Reaction Scheme V a compound of Formula XXXVII is nitrated using a suitable nitrating agent such as nitric acid to provide a 4-nitrotetraazolo[1,5-*a*][1,5]naphthyridin-5-ol of Formula XXXVIII. The reaction is conveniently carried out by adding nitric acid to the compound of Formula XXXVII in a suitable solvent such as propionic acid and heating the mixture at an elevated temperature.

In step (6) of Reaction Scheme V the hydroxy group of a compound of Formula XXXVIII is converted to a trifluoromethanesulfonate to provide a compound of Formula XXXIX. The reaction is preferably carried out by combining a compound of Formula XXXVIII with a base, preferably a tertiary amine such as triethylamine, in a suitable solvent such as dichloromethane and then slowly adding trifluoromethanesulfonic anhydride. The addition is preferably carried out at a reduced temperature such as, for example, at about 0 °C. The product can be isolated by conventional methods or it can be carried on without isolation as described below in connection with step (7).

In step (7) of Reaction Scheme V a compound of Formula XXXIX is reacted with an amine of formula R₁-NH₂ to provide a 4-nitrotetraazolo[1,5-*a*][1,5]naphthyridin-5-amine of Formula XL. The reaction can be carried out by adding the amine to the reaction mixture resulting from step (6). The reaction can also be carried out by adding the amine

to a solution of the compound of Formula XXXIX and a tertiary amine such as triethylamine in a suitable solvent such as dichloromethane. The reaction may be run at ambient temperature.

In step (8) of Reaction Scheme V a compound of Formula XL is reduced to provide a tetraazolo[1,5-*a*][1,5]naphthyridin-4,5-diamine of Formula XLI. Preferably, the reduction is carried out using platinum on carbon as the heterogeneous hydrogenation catalyst. The reaction can conveniently be carried out on a Parr apparatus in a suitable solvent such as ethanol.

In step (9) of Reaction Scheme V a compound of Formula XLI is cyclized with a thiourea or cyanogen bromide to provide a 1*H*-tetraazolo[1,5-*a*]imidazo[4,5-*c*][1,5]naphthyridin-2-amine of Formula XLII. The cyclization reaction can be carried out according to the methods described in step (1) of Reaction Scheme I.

In step (10) of Reaction Scheme V a compound of Formula XLII is reacted with triphenylphosphine to provide a *N*⁴-triphenylphosphinyl-1*H*-imidazo[4,5-*c*][1,5]naphthyridine-2,4-diamine of Formula XLIII. The reaction can be carried out by heating a compound of Formula XLII with triphenylphosphine in a suitable solvent such as 1,2-dichlorobenzene.

In step (11) of Reaction Scheme V a compound of Formula XLIII is hydrolyzed to provide a 1*H*-imidazo[4,5-*c*][1,5]naphthyridine-2,4-diamine of Formula XLIV, which is a subgenus of Formulas I, II, and VI. The hydrolysis can be carried out by conventional methods such as by heating in a lower alkanol in the presence of an acid.

In Reaction Scheme V, when *m* is 1, step (12) is used to convert a 1*H*-imidazo[4,5-*c*][1,5]naphthyridine-2,4-diamine of Formula XLIV to a 1*H*-imidazo[4,5-*c*][1,5]naphthyridine-2,4-diamine of Formula XLV, a subgenus of Formulas I, II, and VI, using one of the methods described in step (7) of Reaction Scheme II.

Reaction Scheme V

The methods shown in Reaction Scheme V and the methods described in U.S. Patent No. 6,194,425 (Gerster *et al*) can be used to make other positional isomers of naphthyridines of Formula XLIV or XLV when a 2-aminonicotinic acid or a 3-aminoisonicotinic acid is used as the starting material instead of a compound of Formula XXXIII.

Compounds of the invention can also be prepared according to Reaction Scheme VI, wherein R_b is alkyl, alkoxy, or $-N(R_9)_2$; E is carbon (imidazoquinoline ring system) or nitrogen (imidazonaphthyridine ring system); n is an integer from 0 to 4 (imidazoquinoline ring system) or 0 to 3 (imidazonaphthyridine ring system); R_2' is as defined above; and R_{2b} and R_{1b} are subsets of R_2 and R_1 as defined above that do not include those substituents

that one skilled in the art would recognize as being susceptible to reduction under the acidic hydrogenation conditions of the reaction. These susceptible groups include, for example, alkenyl, alkynyl, and aryl groups and groups bearing nitro substituents.

As shown in Reaction Scheme VI, an 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine or 1*H*-imidazo[4,5-*c*][1,5]naphthyridine-2,4-diamine of Formula XLVI can be reduced to a 6,7,8,9-tetrahydroquinoline or tetrahydronaphthyridine of Formula XLVII. Compounds of Formula XLVI can be prepared according to the methods described in Reaction Schemes I, II, III, or V. The reaction is conveniently carried out under heterogeneous hydrogenation conditions by adding platinum (IV) oxide to a solution of the compound of Formula XLVI in trifluoroacetic acid and placing the reaction under hydrogen pressure. The reaction can be carried out on a Parr apparatus at ambient temperature.

Reaction Scheme VI

For certain embodiments, compounds of the invention can be prepared according to Reaction Scheme VII, wherein D, E, R, R₁, R₃, R_{4a}, Q_a, and m are as defined above; n is an integer from 0 to 4 (imidazoquinoline ring system) or 0 to 3 (imidazonaphthyridine ring system) with the proviso that when m is 1, n is 0 or 1; R_{6x} is O or S; and R₁₁ is -C(O)-O-C₁₋₄ alkyl or hydrogen. In step (1) of Reaction Scheme I, a quinoline- or [1,5]naphthyridine-3,4-diamine of Formula XLVIII is reacted with a compound of Formula XLIX to provide a compound of Formula L. The reaction can be conveniently carried out under by combining a compound of Formula XLIX with a diamine of Formula XLVIII in a suitable solvent such as a lower alcohol or chloroform in the presence of an acid such as acetic acid, *p*-toluenesulfonic acid monohydrate, or a combination thereof. If cyclization and imidazole-ring formation does not occur under acidic conditions to provide a compound of Formula L, the uncyclized intermediate can be treated with a base such as sodium methoxide in a suitable solvent such as methanol to effect the cyclization. The

reaction in step (1) of Reaction Scheme I may also be carried out according to the method of Kukla, M. J. et al., *J. Med. Chem.*, 34, pp. 3187-3197 (1991) or Elliott et al., *J. Org. Chem.*, 62, pp. 8071-8075, (1997).

Many compounds of Formula XLVIII are known and can be readily prepared using known synthetic routes; see for example, U.S. Patent Nos. 4,689,338 (Gerster), 4,929,624 (Gerster *et al.*), 5,268,376 (Gerster), 5,389,640 (Gerster *et al.*), 6,194,425 (Gerster *et al.*), 6,331,539 (Crooks *et al.*), 6,451,810 (Coleman *et al.*), 6,541,485 (Crooks *et al.*), 6,660,747 (Crooks *et al.*), 6,670,372 (Charles *et al.*), 6,683,088 (Crooks *et al.*), 6,656,938 (Crooks *et al.*), and 6,664,264 (Dellaria *et al.*), U. S. Patent Application Publication No. 2004/0147543 (Hays *et al.*), and International Patent Application Publication Nos. WO2005/020999 (Lindstrom *et al.*) and WO2005/051317 (Krepski *et al.*).

Compounds of Formula XLIX are known or can be prepared by known methods. For example, compounds where $-Q_a-$ is $-C(O)-O-$ can be prepared by combining *O*-methylisourea or *S*-methylisothiourea or a salt thereof with one or two equivalents of a chloroformate, for example, methyl chloroformate in a suitable solvent such as 1,2-dichloroethane in the presence of a base such as pyridine. For some compounds, the reaction may be carried out in water in the presence of a base such as sodium hydroxide. The reaction can be carried out at room temperature. The preparation of compounds wherein $-Q_a-R_{4a}$ is $-C(O)-O-CH_3$ have been reported in Skibinski et al., *J. Appl. Chem.*, 37, pp. 291-294 (1993), Hamprecht, G. et al, *Liebigs Ann. Chem.*, 12, pp. 2363-2370 (1985), Viswanathan, N. Indian Patent 168,784; *Chem. Abstr.* 118, 22237, (1993), and U. S. Patent No. 4,026,936 (Lauer and Walser). The preparation of compounds where $-Q_a-R_{4a}$ is $-C(O)-CH_3$ or $-S(O)_2-CH_3$ has also been reported; see, Williams, et al., *J. Antibiot.*, 2, pp. 189-201, (1998).

In step (2) of Reaction Scheme VII, a 1*H*-imidazo[4,5-*c*]quinoline or 1*H*-imidazo[4,5-*c*][1,5]naphthyridine of Formula L is oxidized to provide a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide or 1*H*-imidazo[4,5-*c*][1,5]naphthyridine-5*N*-oxide of Formula LI using a conventional oxidizing agent capable of forming *N*-oxides. The reaction is conveniently carried out by adding 3-chloroperoxybenzoic acid to a solution of a compound of Formula L in a solvent such as chloroform or dichloromethane. The reaction can be carried out at room temperature.

In step (3) of Reaction Scheme VII, a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide or 1*H*-imidazo[4,5-*c*][1,5]naphthyridine-5*N*-oxide of Formula LI is aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine or 1*H*-imidazo[4,5-*c*][1,5]naphthyridin-4-amine of Formula LII, a subgenus of Formulas I and II. Step (3) involves the activation of an *N*-oxide of Formula LI by conversion to an ester and then reacting the ester with an
5 aminating agent. Suitable activating agents include alkyl- or arylsulfonyl chlorides such as benzenesulfonyl chloride, methanesulfonyl chloride, or *p*-toluenesulfonyl chloride. Suitable aminating agents include ammonia, in the form of ammonium hydroxide, for example, and ammonium salts such as ammonium carbonate, ammonium bicarbonate, and
0 ammonium phosphate. The reaction is conveniently carried out by adding ammonium hydroxide to a solution of the *N*-oxide of Formula LI in a suitable solvent such as dichloromethane or chloroform and then adding *p*-toluenesulfonyl chloride or benzenesulfonyl chloride. The reaction can be carried out at room temperature.

Alternatively, the oxidation and amination can be carried out as a one-pot
5 procedure without isolating the *N*-oxide of Formula LI by adding 3-chloroperoxybenzoic acid to a solution of a compound of Formula L in a solvent such as dichloromethane or chloroform and then adding ammonium hydroxide and *p*-toluenesulfonyl chloride or benzenesulfonyl chloride.

In Reaction Scheme VII, when *m* is 1, step (4) can be used to convert a compound
0 of Formula LII to a 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine or 1*H*-imidazo[4,5-*c*][1,5]naphthyridine-2,4-diamine of Formula LIII, a subgenus of Formulas I and II in which *R*₃ is *R*_{3a}, using one of the methods described in step (7) of Reaction Scheme II.

Carbamates of Formula LII, wherein -*Q*_a-*R*_{4a} is -C(O)-O-CH₃, are also useful
5 precursors to 1*H*-imidazo[4,5-*c*]quinoline-2,4-diamines of Formula XVIII wherein both *R*₂ and *R*₂' are hydrogen. The 2-amino substituted compound can be prepared by treating a carbamate of Formula LII with potassium hydroxide in water at an elevated temperature or with hydrogen bromide in acetic acid at room temperature.

Reaction Scheme VII

Compounds of the invention can also be prepared using variations of the synthetic routes shown in Reaction Schemes I through VII that would be apparent to one of skill in the art. For example, the method of step (1) of Reaction Scheme VII can be used with starting materials of Formula XIII, XXIII, XXIX, or XLI to prepare compounds of the invention. Compounds of the invention can also be prepared using the synthetic routes described in the EXAMPLES below.

Prodrugs can be prepared in a variety of ways. For example, a compound wherein R_1 is $-\text{X}_1\text{-OH}$ (e.g. hydroxyalkyl) can be converted into a prodrug wherein R_1 is, for example, $-\text{X}_1\text{-O-C(R}_6\text{)-R}_4$, $-\text{X}_1\text{-O-C(R}_6\text{)-O-R}_4$, or $-\text{X}_1\text{-O-C(R}_6\text{)-N(R}_8\text{)-R}_4$, wherein X_1 , R_4 , R_6 , and R_8 are as defined above, using methods known to one skilled in the art. In addition, a compound wherein R is hydroxy may be converted to an ester, an ether, a carbonate, or a carbamate. For compounds containing an alcohol functional group, a prodrug can be formed by the replacement of the hydrogen atom of the alcohol group with a group such as C_{1-6} alkanoyloxymethyl, 1-(C_{1-6} alkanoyloxy)ethyl, 1-methyl-1-(C_{1-6} alkanoyloxy)ethyl, C_{1-6} alkoxycarbonyloxymethyl,

N-(C₁₋₆ alkoxy carbonyl)aminomethyl, succinoyl, C₁₋₆ alkanoyl, α -aminoC₁₋₄ alkanoyl, arylacyl, -P(O)(OH)₂, -P(O)(O-C₁₋₆ alkyl)₂, C₁₋₆ alkoxy carbonyl, C₁₋₆ alkyl carbamoyl, and α -aminoacyl or α -aminoacyl- α -aminoacyl, where each α -aminoacyl group is independently selected from racemic, D, and L-amino acids. For compounds containing an alcohol functional group, particularly useful prodrugs are esters made from carboxylic acids containing one to six carbon atoms, unsubstituted or substituted benzoic acid esters, or esters made from naturally occurring L-amino acids.

Prodrugs can also be made from a compound containing an amino group by conversion of the amino group to a functional group such as an amide, carbamate, urea, amidine, or another hydrolyzable group using conventional methods. A prodrug of this type can be made by the replacement of a hydrogen atom in an amino group, particularly the amino group at the 4-position, with a group such as -C(O)-R", α -aminoacyl, α -aminoacyl- α -aminoacyl, -C(O)-O-R", -C(O)-N(R''')-R", -C(=NY'')-R", -CH(OH)-C(O)-OY', -CH(OC₁₋₄ alkyl)Y₀, -CH₂Y₃, or -CH(CH₃)Y₃; wherein R" and R''' are each independently C₁₋₁₀ alkyl, C₃₋₇ cycloalkyl, or benzyl, each of which may be unsubstituted or substituted by one or more substituents independently selected from the group consisting of halogen, hydroxy, nitro, cyano, carboxy, C₁₋₆ alkyl, C₁₋₄ alkoxy, aryl, heteroaryl, arylC₁₋₄ alkylenyl, heteroarylC₁₋₄ alkylenyl, haloC₁₋₄ alkylenyl, haloC₁₋₄ alkoxy, -O-C(O)-CH₃, -C(O)-O-CH₃, -C(O)-NH₂, -O-CH₂-C(O)-NH₂, -NH₂, and -S(O)₂-NH₂; with the proviso that R''' may also be hydrogen; each α -aminoacyl group is independently selected from racemic, D, or L-amino acids; Y' is hydrogen, C₁₋₆ alkyl, or benzyl; Y₀ is C₁₋₆ alkyl, carboxyC₁₋₆ alkylenyl, aminoC₁₋₄ alkylenyl, mono-*N*-C₁₋₆ alkylaminoC₁₋₄ alkylenyl, or di-*N,N*-C₁₋₆ alkylaminoC₁₋₄ alkylenyl; and Y₃ is mono-*N*-C₁₋₆ alkylamino, di-*N,N*-C₁₋₆ alkylamino, morpholin-4-yl, piperidin-1-yl, pyrrolidin-1-yl, or 4-C₁₋₄ alkylpiperazin-1-yl. For compounds containing an amine functional group, particularly useful prodrugs are amides derived from carboxylic acids containing one to ten carbon atoms, amides derived from amino acids, and carbamates containing one to ten carbon atoms.

Pharmaceutical Compositions and Biological Activity

Pharmaceutical compositions of the invention contain a therapeutically effective amount of a compound of the invention as described above in combination with a pharmaceutically acceptable carrier.

5 The terms "a therapeutically effective amount" and "effective amount" mean an amount of the compound or salt sufficient to induce a therapeutic or prophylactic effect, such as cytokine induction, cytokine inhibition, immunomodulation, antitumor activity, and/or antiviral activity. Although the exact amount of active compound or salt used in a pharmaceutical composition of the invention will vary according to factors known to those
0 of skill in the art, such as the physical and chemical nature of the compound or salt, the nature of the carrier, and the intended dosing regimen, it is anticipated that the compositions of the invention will contain sufficient active ingredient to provide a dose of about 100 nanograms per kilogram (ng/kg) to about 50 milligrams per kilogram (mg/kg), preferably about 10 micrograms per kilogram (μ g/kg) to about 5 mg/kg, of the compound
5 or salt to the subject. A variety of dosage forms may be used, such as tablets, lozenges, capsules, parenteral formulations, syrups, creams, ointments, aerosol formulations, transdermal patches, transmucosal patches and the like.

 The compounds or salts of the invention can be administered as the single therapeutic agent in the treatment regimen, or the compounds or salts of the invention may
0 be administered in combination with one another or with other active agents, including additional immune response modifiers, antivirals, antibiotics, antibodies, proteins, peptides, oligonucleotides, etc.

 Compounds or salts of the invention have been shown to induce, and certain compounds or salts of the invention may inhibit, the production of certain cytokines in
5 experiments performed according to the tests set forth below. These results indicate that the compounds or salts are useful as immune response modifiers that can modulate the immune response in a number of different ways, rendering them useful in the treatment of a variety of disorders.

 Cytokines whose production may be induced by the administration of compounds
0 or salts of the invention generally include interferon- α (IFN- α) and/or tumor necrosis factor- α (TNF- α) as well as certain interleukins (IL). Cytokines whose biosynthesis may be induced by compounds or salts of the invention include IFN- α , TNF- α , IL-1, IL-6, IL-

10 and IL-12, and a variety of other cytokines. Among other effects, these and other cytokines can inhibit virus production and tumor cell growth, making the compounds or salts useful in the treatment of viral diseases and neoplastic diseases. Accordingly, the invention provides a method of inducing cytokine biosynthesis in an animal comprising
5 administering an effective amount of a compound or salt or composition of the invention to the animal. The animal to which the compound or salt or composition is administered for induction of cytokine biosynthesis may have a disease as described *infra*, for example a viral disease or a neoplastic disease, and administration of the compound or salt may provide therapeutic treatment. Alternatively, the compound or salt may be administered to
0 the animal prior to the animal acquiring the disease so that administration of the compound or salt may provide a prophylactic treatment.

In addition to the ability to induce the production of cytokines, compounds or salts of the invention can affect other aspects of the innate immune response. For example, natural killer cell activity may be stimulated, an effect that may be due to cytokine
5 induction. The compounds or salts may also activate macrophages, which in turn stimulate secretion of nitric oxide and the production of additional cytokines. Further, the compounds or salts may cause proliferation and differentiation of B-lymphocytes.

Compounds or salts of the invention can also have an effect on the acquired immune response. For example, the production of the T helper type 1 (T_H1) cytokine IFN- γ may be induced indirectly and the production of the T helper type 2 (T_H2) cytokines IL-
0 4, IL-5 and IL-13 may be inhibited upon administration of the compounds or salts.

Other cytokines whose production may be inhibited by the administration of certain compounds or salts according to the invention include tumor necrosis factor- α (TNF- α). Among other effects, inhibition of TNF- α production can provide prophylaxis
5 or therapeutic treatment of diseases in animals in which TNF is mediated, making the compounds or salts useful in the treatment of, for example, autoimmune diseases. Accordingly, the invention provides a method of inhibiting TNF- α biosynthesis in an animal comprising administering an effective amount of a compound or salt or composition of the invention to the animal. The animal to which the compound or salt or
0 composition is administered for inhibition of TNF- α biosynthesis may have a disease as described *infra*, for example an autoimmune disease, and administration of the compound or salt may provide therapeutic treatment. Alternatively, the compound or salt may be

administered to the animal prior to the animal acquiring the disease so that administration of the compound or salt may provide a prophylactic treatment.

Whether for prophylaxis or therapeutic treatment of a disease, and whether for effecting innate or acquired immunity, the compound or salt or composition may be administered alone or in combination with one or more active components as in, for example, a vaccine adjuvant. When administered with other components, the compound or salt and other component or components may be administered separately; together but independently such as in a solution; or together and associated with one another such as (a) covalently linked or (b) non-covalently associated, e.g., in a colloidal suspension.

Conditions for which compounds or salts identified herein may be used as treatments include, but are not limited to:

(a) viral diseases such as, for example, diseases resulting from infection by an adenovirus, a herpesvirus (e.g., HSV-I, HSV-II, CMV, or VZV), a poxvirus (e.g., an orthopoxvirus such as variola or vaccinia, or molluscum contagiosum), a picornavirus (e.g., rhinovirus or enterovirus), an orthomyxovirus (e.g., influenzavirus), a paramyxovirus (e.g., parainfluenzavirus, mumps virus, measles virus, and respiratory syncytial virus (RSV)), a coronavirus (e.g., SARS), a papovavirus (e.g., papillomaviruses, such as those that cause genital warts, common warts, or plantar warts), a hepadnavirus (e.g., hepatitis B virus), a flavivirus (e.g., hepatitis C virus or Dengue virus), or a retrovirus (e.g., a lentivirus such as HIV);

EXAMPLES

In the examples below automated flash chromatography was carried out using a COMBIFLASH system (an automated high-performance flash purification product available from Teledyne Isco, Inc., Lincoln, Nebraska, USA), a HORIZON HPFC system (an automated high-performance flash purification product available from Biotage, Inc., Charlottesville, Virginia, USA) or a combination thereof. For some of these purifications, either a FLASH 40+M silica cartridge or a FLASH 65I silica cartridge (both available from Biotage, Inc, Charlottesville, Virginia, USA) was used. The eluent used for each purification is given in the example. In some chromatographic separations, the solvent mixture 80/18/2 v/v/v chloroform/methanol/concentrated ammonium hydroxide (CMA) was used as the polar component of the eluent. In these separations, CMA was mixed with chloroform in the indicated ratio.

A solution of 1,2-diamino-2-methylpropane (42 g, 0.54 mol) in anhydrous NMP (42 mL) was added dropwise over a period of three hours. After the addition was complete, the reaction was allowed to warm to ambient temperature, stirred for five hours, and poured slowly into warm water (4 L) with vigorous stirring. A yellow precipitate formed, and the suspension was stirred for one hour at ambient temperature. The precipitate was isolated by filtration and washed with cold water until the filtrate was colorless. The solid was dissolved in dichloromethane (4 L), and the resulting solution was washed sequentially with saturated aqueous sodium carbonate and brine, dried over magnesium sulfate and sodium sulfate, filtered through a layer of CELITE filter agent, and concentrated under reduced pressure to provide 130 g of *N*-(2-chloro-3-nitroquinolin-4-yl)-2-methylpropane-1,2-diamine as a bright yellow powder.

1-(2-Fluoro-2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine

5 Part A

A solution of *tert*-butyl 2-hydroxy-2-methylpropylcarbamate (19.2 g, 101 mmol) in dichloromethane (500 mL) was stirred at -78°C under a nitrogen atmosphere, and (diethylamino)sulfur trifluoride (DAST) (18.0 g, 112 mmol) was added dropwise. The solution was allowed to warm to room temperature and stirred overnight. Saturated aqueous sodium bicarbonate (150 mL) was added. The organic layer was then separated

and washed sequentially with saturated aqueous sodium bicarbonate (150 mL), water (150 mL), and brine (150 mL); dried over magnesium sulfate; filtered; and concentrated under reduced pressure. The resulting oil was purified by automated flash chromatography (FLASH 65I cartridge, eluting with 10% ethyl acetate in hexane) to provide 13.7 g of *tert*-butyl 2-fluoro-2-methylpropylcarbamate as a light yellow oil that crystallized overnight.

Part B

Hydrogen chloride (50 mL of a 4 M solution in 1,4-dioxane) was added to a solution of *tert*-butyl 2-fluoro-2-methylpropylcarbamate (13.7 g, 71.6 mmol) in dichloromethane (300 mL), and the reaction was stirred for five hours at room temperature and concentrated under reduced pressure. The residue was three times dissolved in toluene and concentrated under reduced pressure to provide 8.08 g of 2-fluoro-2-methylpropan-1-amine hydrochloride as a white solid.

Part C

Triethylamine (2.76 g, 27.3 mmol) was added to a mixture of 2,4-dichloro-3-nitroquinoline (André et al, U.S. Patent Number 4,988,815, Example 2, 4.44 g, 18.2 mmol) and DMF (50 mL), and then 2-fluoro-2-methylpropan-1-amine hydrochloride (2.5 g, 20 mmol) was added. The reaction was stirred at room temperature overnight and then poured into water (500 mL). The resulting mixture was stirred for 15 minutes. A solid was present and was isolated by filtration to provide 4.8 g of 2-chloro-*N*-(2-fluoro-2-methylpropyl)-3-nitroquinolin-4-amine as a yellow solid.

Part D

A Parr vessel was charged sequentially with 2-chloro-*N*-(2-fluoro-2-methylpropyl)-3-nitroquinolin-4-amine (4.75 g, 15.8 mmol), acetonitrile (50 mL), and 5% platinum on carbon (475 mg) and placed under hydrogen pressure (40 psi, 2.8×10^5 Pa) overnight. The reaction mixture was filtered through a layer of CELITE filter aid. The filter cake was washed with methanol. The filtrate was concentrated under reduced pressure to provide 4.45 g of 2-chloro-*N*⁴-(2-fluoro-2-methylpropyl)quinoline-3,4-diamine as a solid.

The reaction was heated at reflux for an additional two hours, and the reaction was still incomplete. Additional cyanogen bromide (2.1 g, 19.8 mmol) was added, and the reaction was heated at reflux overnight, allowed to cool, and filtered. The filter cake was washed with diethyl ether (100 mL) and then dried under vacuum for four hours to provide 2.32 g of 4-chloro-1-(2-fluoro-2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinolin-2-amine hydrobromide as a brown solid.

Additional ammonia in methanol was added after three days and again after four days. When the reaction was complete, the volatiles were removed under reduced pressure, and the residue was combined with material from another run. The crude product was purified by automated flash chromatography (silica cartridge, eluting with aqueous ammonium hydroxide:methanol:dichloromethane in a gradient from 0:0:100 to 1:14:85) to provide 270 mg of 1-(2-fluoro-2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine as a light tan solid, mp 251 °C.

Examples 149 – 171

Part A

Triethylamine (30.98 g, 306.1 mmol) was added to a solution of 2,4-dichloro-3-nitroquinoline (50.0 g, 204 mmol) in DMF (200 mL). A solution of *N*-Boc-ethylenediamine (32.7 g, 204 mmol) in DMF (100 mL) was then added in small portions. The reaction was stirred at room temperature, and then most of the DMF was removed under reduced pressure. Water (600 mL) was added to the residue, and the mixture was stirred for three hours. A solid formed and was isolated by filtration, washed with water, and dried under house vacuum to provide 71 g of *tert*-butyl 2-[(2-chloro-3-nitroquinolin-4-yl)amino]ethylcarbamate as a yellow solid. A portion of the material (15 g) was dissolved in dichloromethane (200 mL), and the resulting solution was washed with brine (2 x 100 mL) and deionized water (2 x 100 mL), dried over magnesium sulfate, filtered, concentrated under reduced pressure, and further dried on a vacuum pump for three days to provide 13.99 g of product.

Part B

Platinum on carbon (1.5 g of 5%) was added to a solution of *tert*-butyl 2-[(2-chloro-3-nitroquinolin-4-yl)amino]ethylcarbamate (13.99 g, 38.19 mmol) in acetonitrile (100 mL) in a Parr vessel. The mixture was placed under hydrogen pressure (30 psi, 2.1 x

10⁵ Pa) for three hours and then filtered through a layer of CELITE filter agent. The filtrate was concentrated under reduced pressure and further dried overnight on a vacuum pump to provide 13.46 g of *tert*-butyl 2-[(3-amino-2-chloroquinolin-4-yl)amino]ethylcarbamate as a light brown solid.

5 Part C

Cyanogen bromide (4.6 g, 44 mmol) was added to a solution of *tert*-butyl 2-[(3-amino-2-chloroquinolin-4-yl)amino]ethylcarbamate (13.46 g, 39.96 mmol) in ethanol (140 mL), and the reaction was heated at reflux overnight. An analysis by LC/MS indicated the presence of starting material, and additional cyanogen bromide (1.25 g, 12.0 mmol) was
10 added. The reaction was heated at reflux for an additional two hours, and the reaction was still incomplete. Additional cyanogen bromide (1.25 g, 12.0 mmol) was added, and the reaction was heated at reflux for two hours and allowed to cool to room temperature. Most of the solvent was removed under reduced pressure, and aqueous sodium hydroxide (700 mL of 2 N) was added. The mixture was stirred for 30 minutes, and the aqueous
15 portion was decanted away. Ethyl acetate (500 mL) was added, and the mixture was stirred for 20 minutes. The ethyl acetate was then decanted away, and the residue was filtered. The filter cake was washed several times with diethyl ether (1 L total), and the resulting solid was stirred vigorously with diethyl ether (500 mL). The solid was collected by filtration and dried under vacuum overnight to provide 7.02 g of *tert*-butyl 2-(2-amino-
20 4-chloro-1*H*-imidazo[4,5-*c*]quinolin-1-yl)ethylcarbamate as a reddish-brown solid.

Part D

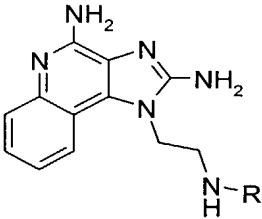

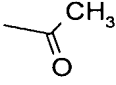

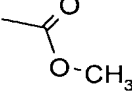

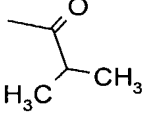

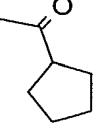

tert-Butyl 2-(2-amino-4-chloro-1*H*-imidazo[4,5-*c*]quinolin-1-yl)ethylcarbamate (3.5 g, 9.7 mmol) and ammonia (approximately 100 mL of a 7 N solution in methanol) were added to a pressure vessel, which was sealed and heated at 150 °C overnight. The
25 volatiles were removed under reduced pressure, and the residue was purified by automated flash chromatography (silica cartridge, eluting with aqueous ammonium hydroxide:methanol:dichloromethane in a gradient from 0:0:100 to 1.5:28.5:70) to provide 840 mg of 1-(2-aminoethyl)-1*H*-imidazo[4,5-*c*]quinoline-2,4-diamine as a dark grey solid.

imidazo[4,5-*c*]quinoline-2,4-diamine (24.4 mg, 0.100 mmol) in DMA (1 mL). The tube was then capped and vortexed for overnight at room temperature. Ammonium hydroxide (250 μ L) was added to each tube, and the contents were vortexed overnight at room temperature. Two drops of water were added to the test tube, and the solvent was removed by vacuum centrifugation. The compounds were purified by reversed phase prep HPLC according to the method described in Examples 19 – 42, Part F. The table below shows the reagent used for each example, the structure of the resulting compound, and the observed accurate mass for the isolated trifluoroacetate salt.

A precipitate formed and was collected by filtration, washed with a minimal amount of dichloromethane, and dried to provide 0.9 g of methyl [1-(2-methylpropyl)-5-oxido-1*H*-imidazo[4,5-*c*][1,5]naphthyridin-2-yl]carbamate as a solid.

Part C

A suspension of methyl [1-(2-methylpropyl)-5-oxido-1*H*-imidazo[4,5-*c*][1,5]naphthyridin-2-yl]carbamate (0.9 g, 3 mmol) in methanol (25 mL) was stirred vigorously and heated to 50 °C. Concentrated ammonium hydroxide (0.95 mL, 14 mmol) was added followed by benzenesulfonyl chloride (1.06 g, 5.99 mmol), which was added dropwise. The mixture was stirred for two hours at 50 °C. An analysis by LC/MS indicated the reaction was incomplete. Additional benzenesulfonyl chloride (1.06 g) and concentrated ammonium hydroxide (0.95 mL) were added, and the reaction mixture was stirred overnight at 45 °C. The solvent was removed under reduced pressure, and the residue dissolved in chloroform (100 mL). The solution was washed sequentially with aqueous sodium carbonate (2 x 100 mL of 4% w/w) and water (100 mL) and then purified by automated flash chromatography (40+M silica cartridge, eluting with 5% to 25% CMA in chloroform) followed by recrystallization from ethyl acetate to provide 0.28 g of methyl [4-amino-1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*][1,5]naphthyridin-2-yl]carbamate as a yellow solid.

CYTOKINE INDUCTION IN HUMAN CELLS

An in vitro human blood cell system is used to assess cytokine induction. Activity is based on the measurement of interferon (α) and tumor necrosis factor (α) (IFN- α and TNF- α , respectively) secreted into culture media as described by Testerman et. al. in "Cytokine Induction by the Immunomodulators Imiquimod and S-27609", *Journal of Leukocyte Biology*, 58, 365-372 (September, 1995).

Blood Cell Preparation for Culture

Whole blood from healthy human donors is collected by venipuncture into vacutainer tubes or syringes containing EDTA. Peripheral blood mononuclear cells (PBMC) are separated from whole blood by density gradient centrifugation using HISTOPAQUE-1077 (Sigma, St. Louis, MO) or Ficoll-Paque Plus (Amersham Biosciences Piscataway, NJ). Blood is diluted 1:1 with Dulbecco's Phosphate Buffered Saline (DPBS) or Hank's Balanced Salts Solution (HBSS). Alternately, whole blood is placed in Accuspin (Sigma) or LeucoSep (Greiner Bio-One, Inc., Longwood, FL) centrifuge frit tubes containing density gradient medium. The PBMC layer is collected and washed twice with DPBS or HBSS and re-suspended at 4×10^6 cells/mL in RPMI

complete. The PBMC suspension is added to 96 well flat bottom sterile tissue culture plates containing an equal volume of RPMI complete media containing test compound.

Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. The compounds are generally tested at concentrations ranging from 30-0.014 μM . Controls include cell samples with media only, cell samples with DMSO only (no compound), and cell samples with reference compound.

Incubation

The solution of test compound is added at 60 μM to the first well containing RPMI complete and serial 3 fold dilutions are made in the wells. The PBMC suspension is then added to the wells in an equal volume, bringing the test compound concentrations to the desired range (usually 30-0.014 μM). The final concentration of PBMC suspension is 2×10^6 cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 to 24 hours at 37°C in a 5% carbon dioxide atmosphere.

Separation

Following incubation the plates are centrifuged for 10 minutes at 1000 rpm (approximately 200 x g) at 4°C. The cell-free culture supernatant is removed and transferred to sterile polypropylene tubes. Samples are maintained at -30 to -70°C until analysis. The samples are analyzed for IFN- α by ELISA and for TNF- α by IGEN/BioVeris Assay.

Interferon (α) and Tumor Necrosis Factor (α) Analysis

IFN- α concentration is determined with a human multi-subtype colorimetric sandwich ELISA (Catalog Number 41105) from PBL Biomedical Laboratories, Piscataway, NJ. Results are expressed in pg/mL.

The TNF- α concentration is determined by ORIGEN M-Series Immunoassay and read on an IGEN M-8 analyzer from BioVeris Corporation, formerly known as IGEN International, Gaithersburg, MD. The immunoassay uses a human TNF- α capture and

detection antibody pair (Catalog Numbers AHC3419 and AHC3712) from Biosource International, Camarillo, CA. Results are expressed in pg/mL.

Assay Data and Analysis

5 In total, the data output of the assay consists of concentration values of TNF- α and IFN- α (y-axis) as a function of compound concentration (x-axis).

Analysis of the data has two steps. First, the greater of the mean DMSO (DMSO control wells) or the experimental background (usually 20 pg/mL for IFN- α and 40 pg/mL for TNF- α) is subtracted from each reading. If any negative values result from
0 background subtraction, the reading is reported as " * ", and is noted as not reliably detectable. In subsequent calculations and statistics, " * ", is treated as a zero. Second, all background subtracted values are multiplied by a single adjustment ratio to decrease experiment to experiment variability. The adjustment ratio is the area of the reference compound in the new experiment divided by the expected area of the reference compound
5 based on the past 61 experiments (unadjusted readings). This results in the scaling of the reading (y-axis) for the new data without changing the shape of the dose-response curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- α,α -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) and the expected area is the sum of the median dose values from the past 61
0 experiments.

The minimum effective concentration is calculated based on the background-subtracted, reference-adjusted results for a given experiment and compound. The minimum effective concentration (μ molar) is the lowest of the tested compound concentrations that induces a response over a fixed cytokine concentration for the tested
5 cytokine (usually 20 pg/mL for IFN- α and 40 pg/mL for TNF- α). The maximal response is the maximal amount of cytokine (pg/ml) produced in the dose-response.

CYTOKINE INDUCTION IN HUMAN CELLS (High Throughput Screen)

0 The CYTOKINE INDUCTION IN HUMAN CELLS test method described above was modified as follows for high throughput screening.

Blood Cell Preparation for Culture

Whole blood from healthy human donors is collected by venipuncture into vacutainer tubes or syringes containing EDTA. Peripheral blood mononuclear cells (PBMC) are separated from whole blood by density gradient centrifugation using HISTOPAQUE-1077 (Sigma, St. Louis, MO) or Ficoll-Paque Plus (Amersham Biosciences Piscataway, NJ). Whole blood is placed in Accuspin (Sigma) or LeucoSep (Greiner Bio-One, Inc., Longwood, FL) centrifuge frit tubes containing density gradient medium. The PBMC layer is collected and washed twice with DPBS or HBSS and re-suspended at 4×10^6 cells/mL in RPMI complete (2-fold the final cell density). The PBMC suspension is added to 96-well flat bottom sterile tissue culture plates.

Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The compounds are generally tested at concentrations ranging from 30 - 0.014 μ M. Controls include cell samples with media only, cell samples with DMSO only (no compound), and cell samples with a reference compound 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- α,α -dimethyl-1H-imidazo[4,5-c]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) on each plate. The solution of test compound is added at 7.5 mM to the first well of a dosing plate and serial 3 fold dilutions are made for the 7 subsequent concentrations in DMSO. RPMI Complete media is then added to the test compound dilutions in order to reach a final compound concentration of 2-fold higher (60 - 0.028 μ M) than the final tested concentration range.

Incubation

Compound solution is then added to the wells containing the PBMC suspension bringing the test compound concentrations to the desired range (usually 30 - 0.014 μ M) and the DMSO concentration to 0.4 %. The final concentration of PBMC suspension is 2×10^6 cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 to 24 hours at 37°C in a 5% carbon dioxide atmosphere.

Separation

Following incubation the plates are centrifuged for 10 minutes at 1000 rpm (approximately 200 g) at 4°C. 4-plex Human Panel MSD MULTI-SPOT 96-well plates are pre-coated with the appropriate capture antibodies by MesoScale Discovery, Inc.

(MSD, Gaithersburg, MD). The cell-free culture supernatants are removed and transferred to the MSD plates. Fresh samples are typically tested, although they may be maintained at -30 to -70°C until analysis.

Interferon- α and Tumor Necrosis Factor- α Analysis

MSD MULTI-SPOT plates contain within each well capture antibodies for human TNF- α and human IFN- α that have been pre-coated on specific spots. Each well contains four spots: one human TNF- α capture antibody (MSD) spot, one human IFN- α capture antibody (PBL Biomedical Laboratories, Piscataway, NJ) spot, and two inactive bovine serum albumin spots. The human TNF- α capture and detection antibody pair is from MesoScale Discovery. The human IFN- α multi-subtype antibody (PBL Biomedical Laboratories) captures all IFN- α subtypes except IFN- α F (IFNA21). Standards consist of recombinant human TNF- α (R&D Systems, Minneapolis, MN) and IFN- α (PBL Biomedical Laboratories). Samples and separate standards are added at the time of analysis to each MSD plate. Two human IFN- α detection antibodies (Cat. Nos. 21112 & 21100, PBL) are used in a two to one ratio (weight:weight) to each other to determine the IFN- α concentrations. The cytokine-specific detection antibodies are labeled with the SULFO-TAG reagent (MSD). After adding the SULFO-TAG labeled detection antibodies to the wells, each well's electrochemoluminescent levels are read using MSD's SECTOR HTS READER. Results are expressed in pg/mL upon calculation with known cytokine standards.

Assay Data and Analysis

In total, the data output of the assay consists of concentration values of TNF- α or IFN- α (y-axis) as a function of compound concentration (x-axis).

A plate-wise scaling is performed within a given experiment aimed at reducing plate-to-plate variability associated within the same experiment. First, the greater of the median DMSO (DMSO control wells) or the experimental background (usually 20 pg/mL

for IFN- α and 40 pg/mL for TNF- α) is subtracted from each reading. Negative values that may result from background subtraction are set to zero. Each plate within a given experiment has a reference compound that serves as a control. This control is used to calculate a median expected area under the curve across all plates in the assay. A plate-wise scaling factor is calculated for each plate as a ratio of the area of the reference compound on the particular plate to the median expected area for the entire experiment. The data from each plate are then multiplied by the plate-wise scaling factor for all plates. Only data from plates bearing a scaling factor of between 0.5 and 2.0 (for both cytokines IFN- α , TNF- α) are reported. Data from plates with scaling factors outside the above mentioned interval are retested until they bear scaling factors inside the above mentioned interval. The above method produces a scaling of the y-values without altering the shape of the curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- α,α -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91). The median expected area is the median area across all plates that are part of a given experiment.

A second scaling may also be performed to reduce inter-experiment variability (across multiple experiments). All background-subtracted values are multiplied by a single adjustment ratio to decrease experiment-to-experiment variability. The adjustment ratio is the area of the reference compound in the new experiment divided by the expected area of the reference compound based on an average of previous experiments (unadjusted readings). This results in the scaling of the reading (y-axis) for the new data without changing the shape of the dose-response curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- α,α -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) and the expected area is the sum of the median dose values from an average of previous experiments.

The minimum effective concentration is calculated based on the background-subtracted, reference-adjusted results for a given experiment and compound. The minimum effective concentration (μ molar) is the lowest of the tested compound concentrations that induces a response over a fixed cytokine concentration for the tested cytokine (usually 20 pg/mL for IFN- α and 40 pg/mL for TNF- α). The maximal response is the maximal amount of cytokine (pg/ml) produced in the dose-response.

Certain compounds of the invention modulate cytokine biosynthesis by inhibiting production of tumor necrosis factor α (TNF- α) when tested using the method described below. Particular examples, include but are not limited to, the compounds of Examples 7, 8, and 9.

TNF- α INHIBITION IN MOUSE CELLS

The mouse macrophage cell line Raw 264.7 is used to assess the ability of compounds to inhibit tumor necrosis factor- α (TNF- α) production upon stimulation by lipopolysaccharide (LPS).

Single Concentration Assay:

Blood Cell Preparation for Culture

Raw cells (ATCC) are harvested by gentle scraping and then counted. The cell suspension is brought to 3×10^5 cells/mL in RPMI with 10 % fetal bovine serum (FBS).

Cell suspension (100 μ L) is added to 96-well flat bottom sterile tissues culture plates (Becton Dickinson Labware, Lincoln Park, NJ). The final concentration of cells is 3×10^4 cells/well. The plates are incubated for 3 hours. Prior to the addition of test compound the medium is replaced with colorless RPMI medium with 3 % FBS.

Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. Compounds are tested at 5 μ M. LPS (Lipopolysaccharide from *Salmonella typhimurium*, Sigma-Aldrich) is diluted with colorless RPMI to the EC₇₀ concentration as measured by a dose response assay.

Incubation

A solution of test compound (1 μ L) is added to each well. The plates are mixed on a microtiter plate shaker for 1 minute and then placed in an incubator. Twenty minutes later the solution of LPS (1 μ L, EC₇₀ concentration \sim 10 ng/ml) is added and the plates are mixed for 1 minute on a shaker. The plates are incubated for 18 to 24 hours at 37 °C in a 5 % carbon dioxide atmosphere.

TNF- α Analysis

Following the incubation the supernatant is removed with a pipet. TNF- α concentration is determined by ELISA using a mouse TNF- α kit (from Biosource International, Camarillo, CA). Results are expressed in pg/mL. TNF- α expression upon LPS stimulation alone is considered a 100% response.

Dose Response Assay:

Blood Cell Preparation for Culture

Cell suspension (250 μ L) is added to 48-well flat bottom sterile tissues culture plates (Costar, Cambridge, MA). The final concentration of cells is 1×10^5 cells/well. The plates are incubated for 3 hours. Prior to the addition of test compound the medium is replaced with colorless RPMI medium with 3 % FBS.

Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. Compounds are tested at 0.03, 0.1, 0.3, 1, 3, 5 and 10 μ M. LPS (Lipopolysaccharide from *Salmonella typhimurium*, Sigma-Aldrich) is diluted with colorless RPMI to the EC₇₀ concentration as measured by dose response assay.

Incubation

A solution of test compound (200 μ l) is added to each well. The plates are mixed on a microtiter plate shaker for 1 minute and then placed in an incubator. Twenty minutes later the solution of LPS (200 μ L, EC₇₀ concentration ~ 10 ng/ml) is added and the plates are mixed for 1 minute on a shaker. The plates are incubated for 18 to 24 hours at 37 $^{\circ}$ C in a 5 % carbon dioxide atmosphere.

TNF- α Analysis

Following the incubation the supernatant is removed with a pipet. TNF- α concentration is determined by ELISA using a mouse TNF- α kit (from Biosource International, Camarillo, CA). Results are expressed in pg/mL. TNF- α expression upon LPS stimulation alone is considered a 100% response.
